STAGES OF DATA PROCESSING

Collection

Gather data from statistics, use behavior, profits, and loss statements of a company.

Preparation

Screen data to ensure that errors and irrelevant data are removed.

Input

Convert or code the checked data into machine-friendly form so that the device can process it.

Data Processing

Control and execute the input data using a formula or program to help produce great and relevant outputs.

Output

Display the data to the user in various formats, such as graphs, tables, audio, videos, and documents. This allows for saving and processing it again in the next data cycle.

Storage

Store the data, settings, and other information for future use. This allows users to access, retrieve, and transfer data when needed.
